CS 228 : Logic in Computer Science

Krishna. S

The DPLL Algorithm

Input : CNF formula F.

1. Initialise α as the empty assignment
2. While there is a unit clause L in $F|\alpha$, add $L = 1$ to α (unit propagation)
3. If $F|\alpha$ contains no clauses, then stop and output α
4. If $F|\alpha$ contains the empty clause, then apply the learning procedure to add a new clause C to F. If it is the empty clause, output UNSAT. Otherwise, backtrack to the highest level at which C is a unit clause, go to line 2.
5. Decide on a new assignment $p = b$ to be added to α, goto line 2.

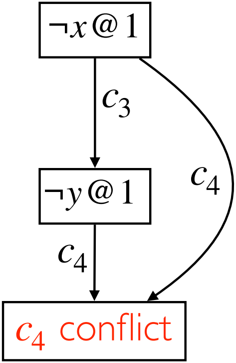
DPLL Example

$c_1 = \neg x \vee \neg y$

$c_2 = \neg x \vee y$

$c_3 = x \vee \neg y$

$c_4 = x \vee y$



Clause learnt : x (Resolve c_4 with c_3)

DPLL Example

If all the literals in a clause are assigned values that make the clause false, then that clause becomes an empty clause.

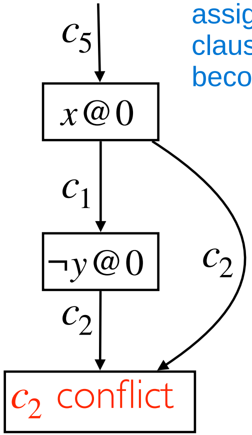
$c_1 = \neg x \vee \neg y$

$c_2 = \neg x \vee y$

$c_3 = x \vee \neg y$

$c_4 = x \vee y$

$c_5 = x$



Clause learnt : Resolve c_2 with c_1, c_5. Empty clause.

DPLL Correctness

Termination

A sequence of decisions which lead to a conflict cannot be repeated : the variables in the learned clause are all decision variables. In a future assignment, if all but one of these are set to false, the remaining one will not be a decision variable.

DPLL Correctness

Termination

A sequence of decisions which lead to a conflict cannot be repeated : the variables in the learned clause are all decision variables. In a future assignment, if all but one of these are set to false, the remaining one will not be a decision variable.

Correctness

Correctness is straightforward : $F \vdash$ the learned clause. Thus, if the empty clause is learnt, then F is unsat. Otherwise, if DPLL terminates with a satisfying assignment α, then the input formula is also satisfied by α.

Modern SAT Solvers

Numerous enhancements/heuristics

- Decision heuristics to choose decision variables
- Random restarts

First Order Logic

FOL

Extends propositional logic

- Propositional logic : atomic formulas have no internal structure
- FOL : atomic formulas are predicates that assert a relationship between certain elements
- Quantification in FOL : ability to assert that a certain property holds for all elements or only for some element.
- Formulae in FOL are over some signature.

Signatures

- A vocabulary or signature τ is a set consisting of
  - constants $c_1, c_2, \ldots$
  - Relation symbols $R_1, R_2 \ldots$, each with some arity k, denoted R_i^k

    Relation bw objects of domain.
  - Function symbols $f_1, \ldots$ each with some arity k, denoted f_i^k

    Maps one object to other in domain.
- We look at finite signatures
- $\tau = (E^2, F^3, f^1)$ is a finite signature with two relations, E with arity 2 and F with arity 3, and a function f with arity 1

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\perp, \top$ called false, true

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\bot, \top$ called false, true
- An element of the infinite set $\mathcal{V} = \{x_1, x_2, \ldots\}$ called variables

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\bot, \top$ called false, true
- An element of the infinite set $\mathcal{V} = \{x_1, x_2, \dots\}$ called variables
- Constants, relations and functions from τ

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\bot, \top$ called false, true
- An element of the infinite set $\mathcal{V} = \{x_1, x_2, \dots\}$ called variables
- Constants, relations and functions from τ
- The symbols $\rightarrow, \neg, \wedge, \vee$

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\bot, \top$ called false, true
- An element of the infinite set $\mathcal{V} = \{x_1, x_2, \dots\}$ called variables
- Constants, relations and functions from τ
- The symbols $\rightarrow, \neg, \wedge, \vee$
- The symbol $\forall$ called the universal quantifier

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\bot, \top$ called false, true
- An element of the infinite set $\mathcal{V} = \{x_1, x_2, \dots\}$ called variables
- Constants, relations and functions from τ
- The symbols $\rightarrow, \neg, \wedge, \vee$
- The symbol $\forall$ called the universal quantifier
- The symbol $\exists$ called the existential quantifier

Symbols in First Order Logic

Formulae of FO, over signature τ, are sequences of symbols, where each symbol is one of the following:

- The symbols $\bot, \top$ called false, true
- An element of the infinite set $\mathcal{V} = \{x_1, x_2, \dots\}$ called variables
- Constants, relations and functions from τ
- The symbols $\rightarrow, \neg, \wedge, \vee$
- The symbol $\forall$ called the universal quantifier
- The symbol $\exists$ called the existential quantifier
- The symbols (and) called paranthesis

These symbols are assumed to be present for any structure.

Terms

Given a signature τ, the set of τ-terms are defined inductively as follows.

- Each variable is a term
- Each constant symbol is a term
- If $t_1, \ldots, t_k$ are terms and f is a k-ary function, then $f(t_1, \ldots, t_k)$ is a term
- Ground Terms : Terms without variables. For instance $f(c_1, \ldots, c_k)$ for constants $c_1, \ldots, c_k$.

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

- $\bot, \top$ are wff

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

- $\bot, \top$ are wff
- If t_1, t_2 are either variables or constants in τ, then $t_1 = t_2$ is a wff

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

- $\bot, \top$ are wff
- If t_1, t_2 are either variables or constants in τ, then $t_1 = t_2$ is a wff
- If t_i is a term, for $1 \leqslant i \leqslant k$ and R is a k-ary relation symbol in τ, then $R(t_1, \ldots, t_k)$ is a wff

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

- $\bot, \top$ are wff
- If t_1, t_2 are either variables or constants in τ, then $t_1 = t_2$ is a wff
- If t_i is a term, for $1 \leqslant i \leqslant k$ and R is a k-ary relation symbol in τ, then $R(t_1, \ldots, t_k)$ is a wff
- If φ and ψ are wff, then $\varphi \to \psi, \varphi \wedge \psi, \varphi \vee \psi, \neg\psi$ are all wff

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

- $\bot, \top$ are wff
- If t_1, t_2 are either variables or constants in τ, then $t_1 = t_2$ is a wff
- If t_i is a term, for $1 \leqslant i \leqslant k$ and R is a k-ary relation symbol in τ, then $R(t_1, \ldots, t_k)$ is a wff
- If φ and ψ are wff, then $\varphi \to \psi, \varphi \wedge \psi, \varphi \vee \psi, \neg\psi$ are all wff
- If φ is a wff and x is a variable, then $(\forall x)\varphi$ and $(\exists x)\varphi$ are wff

Well formed Formulae

A well-formed formula (wff) over a signature τ is inductively defined as follows:

= is always given to us for any structure,

- $\bot, \top$ are wff
- If t_1, t_2 are either variables or constants in τ, then $t_1 = t_2$ is a wff
- If t_i is a term, for $1 \leqslant i \leqslant k$ and R is a k-ary relation symbol in τ, then $R(t_1, \ldots, t_k)$ is a wff
- If φ and ψ are wff, then $\varphi \to \psi, \varphi \wedge \psi, \varphi \vee \psi, \neg\psi$ are all wff
- If φ is a wff and x is a variable, then $(\forall x)\varphi$ and $(\exists x)\varphi$ are wff
- The second and third are atomic formulae.
- If a formula F occurs as part of another formula G, then F is called a sub formula of G.

A variable present alone is not a WFF, atleast some quantifiers must be attached with it.

Logical Abbreviations : Boolean Connectives

- $\neg\varphi = \varphi \rightarrow \bot$
- $\top = \neg\bot$
- $\varphi \vee \psi = \neg\varphi \rightarrow \psi$
- $\varphi \wedge \psi = \neg(\neg\varphi \vee \neg\psi)$
- $\exists x.\varphi = \neg(\forall x.\neg\varphi)$
- Precedence of operators : Quantifiers and negation highest, followed by $\vee$, $\wedge$, followed by $\rightarrow$.
  - $\forall x\ P(x) \wedge R(x)$ is $[\forall x.[P(x)]] \wedge R(x)$

An Example

Consider the signature $\tau = \{R\}$ where R is a binary relation. The following are FO formulae over this signature.

- $\forall x R(x, x)$ Reflexivity
- $\forall x (R(x, x) \to \bot)$ Irreflexivity
- $\forall x \forall y (R(x, y) \to R(y, x))$ Symmetry
- $\forall x \forall y \forall z (R(x, y) \to (R(y, z) \to R(x, z)))$ Transitivity
